

Style Guide for RPSOnline

We, the developers of RPSOnline, have decided to adhere to the principles described within the [Google JS Style Guide](#). However, we would like to emphasize the following principles in code design:

1. Trailing commas are to be used for block variable declaration
2. Variable names with multiple words will be written in “camelCase”
3. Function names should be descriptive and verbose.
4. Abbreviations shouldn't be used in general.
5. Block indentation should be used wherever applicable.
6. Function return parameters should be clearly defined.
7. Control structures should always use curly braces.
8. If statements that fit on single line are acceptable.
9. It is acceptable for object literals to be block-like in spacing.
10. Statements in chain-syntax should be separated by line breaks.
